

# Un site qui marche tout le temps

Andy Damevin · Frédéric Blanc

# Andy Damevin

Principal Software Engineer @ IBM

- Love Java (and Web UI)
- Quarkus team since the early days
- Creator of **code.quarkus.io**, **mvnmpm**, **Quinoa**, **Web Bundler** ...and **Roq**

# Frédéric Blanc

Software Architect @ Praxedo

- Love Java since 20 years
- Typical backend dev : CSS allergic ;p
- Marsjug team member, Open source contributor

## Petit sondage 🙋

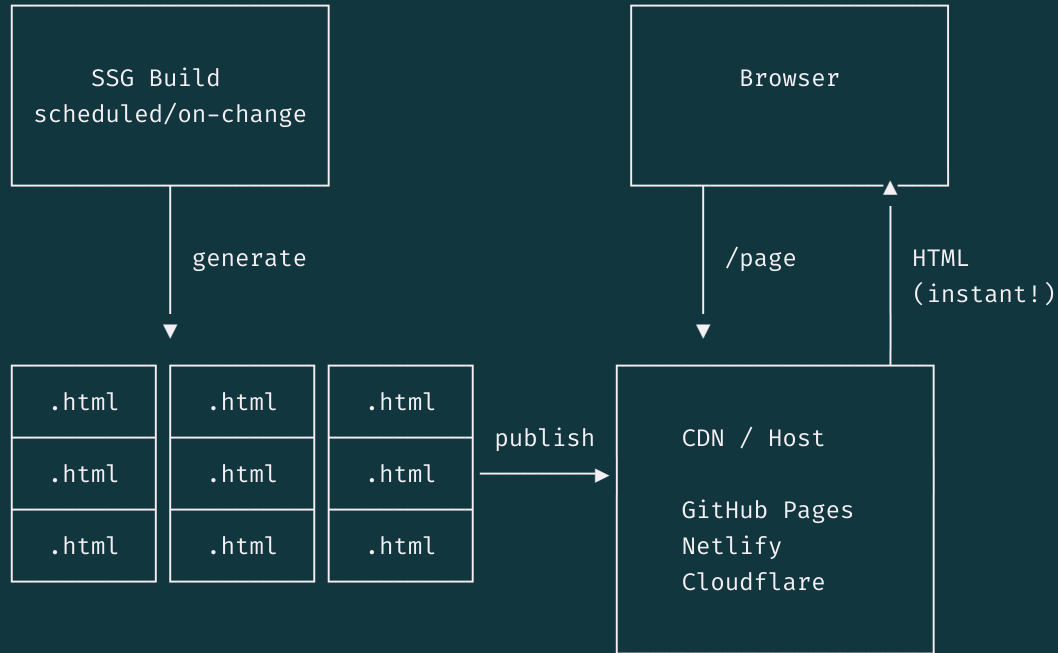

🙋 Allez, on lève la main !

🤔 Site statique, ça vous parle ?

🚀 Déjà **fait** un ?

😄 Aimé le `générateur` ? Vraiment ?

# SSG? Supersonic Star... Gate 🪐?

# Why static is 🙌

- ⚡ Blazing fast
- 💰 Cheap
- 🔍 SEO-friendly
- 🛡️ Secure
- 📦 Portable

🤖 Needed for the future

LLMs and AI search engines **love** clean, static sites

# I am Roq, let me introduce myself

## Content

**Markdown**, AsciiDoc, HTML

**CMS/Editor** + Git sync + AI

**Plugins & Themes** marketplace

## Powered by Quarkus

**Templates**: Qute (TypeSafe!)

**Data**: YAML/JSON (TypeSafe\*)

No Config **TailwindCSS** support

Instant **Live reload**

**Extensions** ecosystem

**Tests & MCP** agent

**Commonhaus  
Foundation**

Try to guess...

What percentage of the web runs on WordPress?

**43%** of the Web!

source: W3Techs 2025

Most of your projects could use static

Even if it shows dynamic content.

# How?

## Dynamic components

A component served by its own backend, embedded in a static page

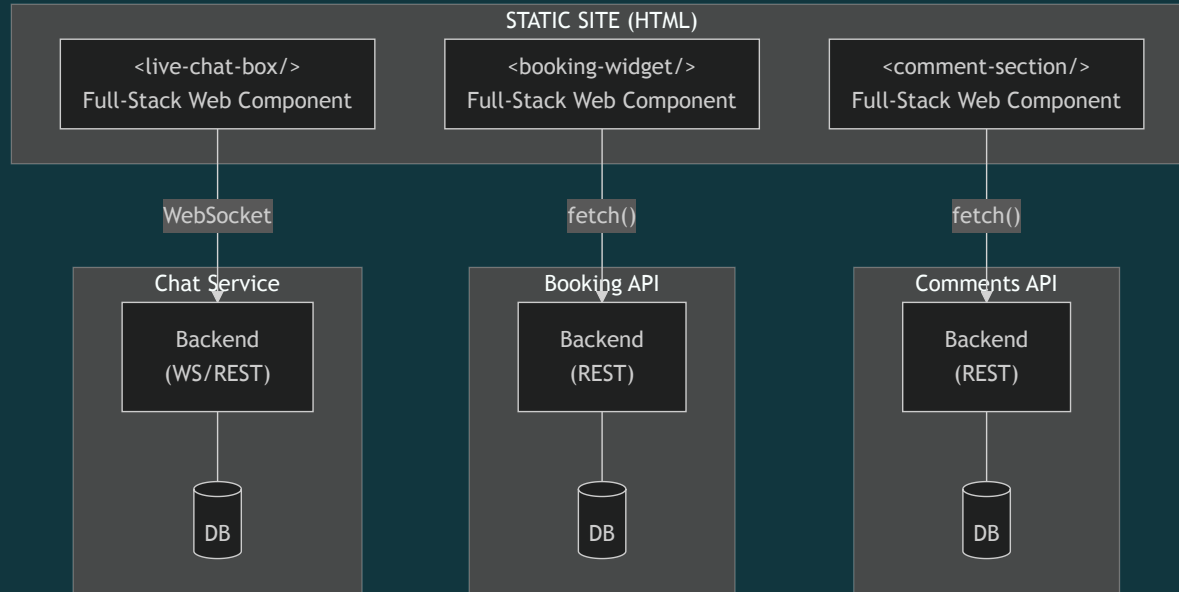

## Split Backend

Static pages using backend api

## Hybrid

Same app, same codebase: static + dynamic

# Dynamic components

# Dynamic components

Static site using components with their own backend.

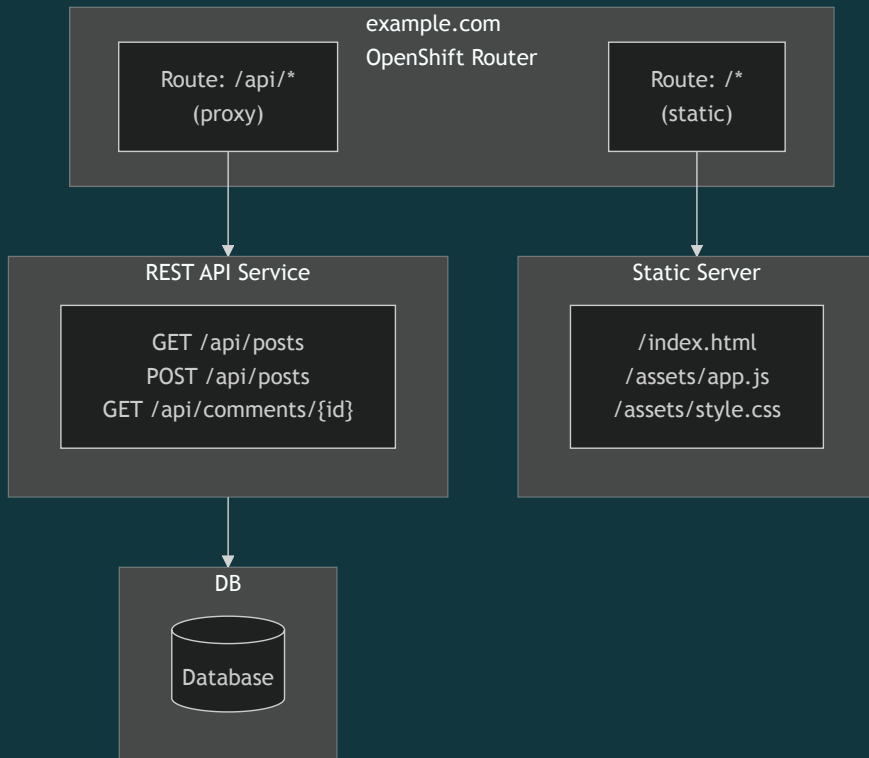

## Strength

- static is pure static (CDN-friendly, cacheable forever).
- static and dynamic are independent (tech stack, release cycles)
- independent lifecycle (beside tag spec and events)

## Weaknesses

- Two apps to build, host, and version
- CSP/CORS if different domain
- Integration friction: keeping theming synchronized

# Split Backend

# Split Backend

Static part and backend possibly share the same domain using different routes.

## Strength

- Simple mental model for frontend devs.
- One codebase/build for the whole frontend, only the API is separate.

## Weaknesses

- Backend API/Frontend coupling

# Hybrid

Everything on one service.

## Strength

- simplicity
- efficiency : most pages are served from cache
- backend/frontend cohesion

## Weaknesses

- a crash is a full crash

## Rule of thumbs

### Best production choices for heavy traffic:

- dynamic components : good when team agility is needed
- split backend : closer to monolith mental model

### Good enough solution for most applications

- hybrid : cheapest, simpler

QUARKUS

Time to Roq

```
roq create my-site
```

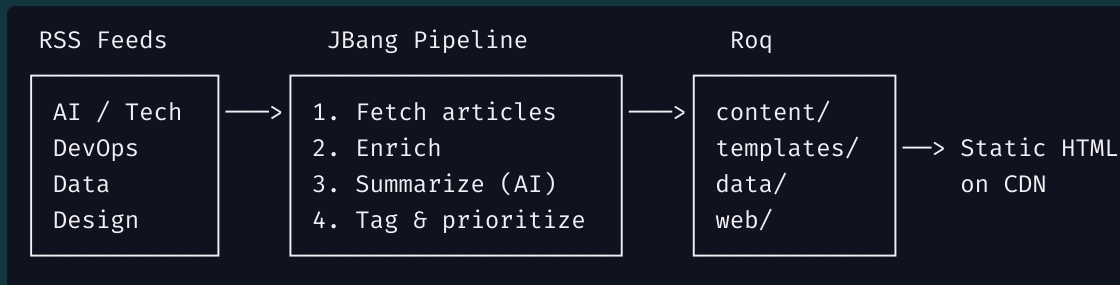

# Already in the wild

-  [mvnnpn.org](https://mvnnpn.org) – Maven NPM bridge
-  [blog.sunix.org](https://blog.sunix.org) – TailwindCSS + AI, very nice result
-  [quarkus.io](https://quarkus.io) – Transitioning to Roq (search is a dynamic component served by a Quarkus microservice)

# devoured.fyi

A daily developer tech digest

Daily. Automated. Static. AI-powered. Java.

# Up Next in Roq

- **I18n** for collections
- **Image processing** plugin (resize, optimize, WebP)
- **New themes:** Blog, Docs, Jugs...

# Questions?
